                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC This nucleotide sequence represents a contig assembled from the CC cDNA inserts in clones sahlc.pk003:7 and sr1.pk0001.g5 encoding CC the entire soybean cyclin delta-1 protein (see AAY31894). These CC clones were respectively isolated from soybean sprayed with CC Authority (TM) herbicide and soybean root cDNA libraries. The CC invention relates to isolated nucleic acid fragments (see AAZ1953-66) CC encoding cyclin A, cyclin delta-1, cyclin delta-2 and cyclin delta-3 CC polypeptides (see AAY3189-902). It also relates to the construction CC of chimeric genes encoding all or a portion of a cyclin, in sense CC or antisense orientation, where expression of the chimeric gene CC results in altered levels of the cyclin protein in a transformed CC host cell. This would have the effect of altering the regulation CC of cell division in those cells. The nucleic acid fragments may be CC used to express cyclins in plant cells to enhance cell tissue CC used to express cyclins should facilitate studies of cell cycle CC all or a portion of cyclins should facilitate studies of cell cycle CC unture, increase the efficiency of gene transfer and help provide constraints that may be useful as bernicides.

New isolated plant cyclin genes, used to develop products for use herbicides and for developing plant breeding programs -25

Claim 7; Page 53-54; 68pp; English

chine se6, pk0028.fll encoding a portion of the cDNA insert in colone se6, pk0028.fll encoding a portion (see AA731895) of a soybean cyclin delta-1 protein. The clone was isolated from a soybean cc embryo (26 days after flowering) cDNA library. The invention cc embryo (26 days after flowering) cDNA library. The invention cc encoding cyclin A, cyclin delta-1, cyclin delta-2 and cyclin delta-3 cc encoding cyclin A, cyclin delta-1, cyclin delta-2 and cyclin delta-3 cc encoding cyclin A, cyclin delta-1, cyclin delta-2 and cyclin, in sense cc of chimeric genes encoding all or a portion of a cyclin, in sense cc or antisense orientation, where expression of the chimeric gene cc or antisense orientation, where expression of the chimeric gene cc results in altered levels of the cyclin protein in a transformed chost cell. This would have the effect of altering the regulation of of cell division in those cells. The nucleic acid fragments may be cused to express cyclins in plant cells to enhance cell tissue culture growth. The availability of nucleic acid sequences encoding call or a portion of cyclins should facilitate studies of cell cycle collure, increase the efficiency of gene transfer and help provide more stable transformations. The proteins can be used as targets cc collurae, increase the efficiency of gene transfer and help provide coll collure, increase the efficiency of gene transfer and help provide collures table transformations. The proteins can be used as targets cc enzymes that may be useful as herbicides.

                                                                                                                                                                                                                                                                                                                                     This sequence represents the CYCD1;1 CDNA from Helianthus tuberosus which encodes a D-type cyclin. The sequence can be used to alter the growth characteristics or architecture of plants by altering the (functional) level in the plant cells of a cell-division controlling protein that can bind to, or phosphorylate, an Rb-like protein, such as a D-type cyclin. Modulation of the cyclin gene is used to increase or decrease the growth rate, provide faster germination, reduce time to flowering, increase the number of flowers, seeds or fruits per plant, increase root development, reduce height and to delay flowering in a range of plants, e.g. legumes, grasses, maize, oilseed rape, wheat, tomato, rice, barley, sunflower,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Helianthus tuberosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Regulating growth and structure of plants by modulating protein controls cell division - specifically a D-type cyclin, and relat chimeric genes and transformed cells and plants, used to alter growth rate, flowering, seed production etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-OCT-1998

This sequence represents the CYCD3;1 cDNA from Nicotianal tabacum which encodes a D-type cyclin. The sequence can be used to alter the growth characteristics or architecture of plants by altering the (functional) level in the plant cells of a cell-division controlling protein that can bind to, or phosphorylate, an Rb-like protein, such as a D-type cyclin. Modulation of the cyclin gene is used to increase or decrease the growth rate, provide faster germination, reduce time to flowering, increase the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     D-type cyclin; growth; plant; cell-division control; p CDC; Rb; retinoblastoma; germination; flowering; seed;
                                                                                                                                                                       Regulating growth and structure of plants by modulating controls cell division - specifically a D-type cyclin, a chimeric genes and transformed cells and plants, used to growth rate, flowering, seed production etc.

The sequence can be used to alter the growth characteristics or architecture of plants by altering the (functional) level in the plant cells of a cell-division controlling protein that can bind to, or phosphorylate, an Rb-like protein, such as a D-type cyclin. Modulation of the cyclin gene is used to increase or decrease the growth rate, provide faster germination, reduce time to flowering, increase the number of flowers, seeds or fruits per plant, increase root development, reduce height and to delay flowering in a range of plants, e.g. legumes, grasses, maize, oilseed rape, wheat, tomato, rice, barley, sunflower,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Regulating growth and structure of plants by modulating protein controls cell division - specifically a D-type cyclin, and relationship genes and transformed cells and plants, used to alter

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the CYCD3;2 cDNA from Nicotiana tabacum which encodes a D-type cyclin. The sequence can be used to alter the growth characteristics or architecture of plants by altering the (functional) level in the plant cells of a cell-division controlling protein that can bind to, or phosphorylate, an Rb-like protein, such as a D-type cyclin. Modulation of the cyclin gene is used to increase or decrease the growth rate, provide faster germination, reduce time to flowering, increase the number of flowers, seeds or fruits per plant, increase root development, reduce height and to delay flowering in a range of plants, e.g. legumes, grasses, malze, oilseed rape, wheat, tomato, rice, barley, sunflower,

The sequence can be used to alter the growth characteristics or architecture of plants by altering the (functional) level in the plant cells of a cell-division controlling protein that can bind to, or phosphorylate, an Rb-like protein, such as a D-type cyclin. Modulation of the cyclin gene is used to increase or decrease the growth rate, provide faster germination, reduce time to flowering, increase the number of flowers, seeds or fruits per plant, increase coot development, reduce height and to delay flowering in a range of plants, e.g. legumes, grasses, maize, oilseed rape, wheat, tomato, rice, barley, sunflower,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Regulating growth and structure of plants by modulating protein that controls cell division - specifically a p-type cyclin, and related chimeric genes and transformed cells and plants, used to alter growth rate, flowering, seed production etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 14; p52-53; 75pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Õ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Š
CC gene that encodes cyclin D (CycD, see AA79323), a protein necessary CC for progression from G1 into S phase. The encoded protein binds to CDX4, and the active CycD-CDX4 hyperphosphorylates retinoblastoma associated protein, releasing the E2F transcription factor which CC activates DNA synthesis. The invention provides maize CycD polynucleotides (see AA294581-84) and polypeptides (see AA79321-24) CC that are involved in cell cycle regulation. Also provided are creombinant expression cassettes (including ZmCycD in sense or creombinant expression cassettes (including ZmCycD in sense or consistence orientation), host cells, transgenic plants (especially CC corn, sorghum, sunflower, safflower, wheat, rice, alfalfa or collseed Brassica) and antibody compositions. A claimed method of CC modulating the level of CycD protein in a cell comprises CC transforming the cell with a recombinant expression cassette comprising a CycD polynucleotide linked to a promoter, and CC growing the cell for a time sufficient to induce expression of the CC plynucleotide sufficient to modulate (increase or decrease) the CC grop protein in the cell. The CycD protein is present in an amount CC sufficient to alter cell division, increase the number of cells concrease the growth rate, increase crop yield, alter plant cheight or size, enhance or inhibit organ (seed, root, shoot, ear, CC tassel, stalk, pollen, stammen) growth, produce organ ablation, cCC produce parthenocarpic fruits, produce male sterile plants,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Maize cyclin D ZmCycD gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 enhance embryogenic response, increase callus induction, provide positive selection, increase plant regeneration, alter the time that cells are arrested in G1 or G0 phase or in a particular cell cycle, improve response to environmental stress including dehydration, heat or cold, increase the number of pods per plant, increase the number of seeds per pod or ear, alter the lag time in seed development, provide hormone-independent cell growth, or increase the growth rate of cells in bioreactors. The level of CycD protein in the cells is transiently modulated by introducing CycD RNA or CycD polypeptides. CycD polynucleotides can be used to identify CycD interacting proteins. All claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1173 BP; 200 A; 366 C; 416 G; 191 T; 0 other;
